PUDining — Eisenhower Matrix

Purdue Dining Court favorites tracker (Java). The DO quadrant is the MVP.

	Urgent	Not Urgent
Important	**DO — MVP** • Fetch today's menu for each dining court from the Purdue Dining API • Parse each menu into a list of food items • Load my favorite foods from favorites.txt • Match favorites against each menu (ignoring capitalization) and print matches by court • Recommend the dining court with the most matches	**SCHEDULE — V2.0+** • Show which meal (breakfast / lunch / dinner) each favorite is served at • Check upcoming days, not just today • Add / remove favorites with commands instead of editing the file • Partial keyword matching (e.g. "chicken" matches "Chicken Carnitas") • Filter by dietary info (vegetarian / vegan) • Run automatically every morning
Not Important	**DELEGATE — Use a library / tool** • HTTP requests → java.net.http.HttpClient • JSON parsing → Gson • Today's date → java.time.LocalDate • Reading files → java.nio.file.Files / Scanner • Version control → Git and GitHub	**DELETE — Cut it** • Mobile app • Graphical UI / web dashboard • AI / machine-learning food recommendations • Calorie and nutrition tracking • User accounts and login • Text message alerts • Food ratings and reviews
